Greater Manchester Domestic Energy Performance Analyzer

- 1) Introduction
- 2) Dataset Explanation
- 3) Power BI Dashboard
- 4) Conclusion
- 5) Recommendations
- 6) References

1) Introduction

The main objective of this assignment is to use Power BI to analyze and visualize Energy Performance Certificate (EPC) data for the local authorities in Manchester from 2013 to 2023. The objective is to develop an engaging and educational Power BI dashboard that offers significant insights into energy performance patterns over the past ten years to stakeholders in the energy industry. This research intends to demonstrate how EPC data may indicate areas for potential improvement while also revealing patterns in energy efficiency across different property types through data transformation, cleansing, and visualization.

The publicly accessible dataset for England and Wales contains extensive information on the energy efficiency of both business and residential buildings. Ranging from A (highest efficiency) to G (lowest efficiency), the data offers important insights into current energy use, emissions, and potential improvements that can improve energy efficiency. When making decisions to increase energy efficiency and lower carbon emissions, homeowners, landlords, property buyers, tenants, and government agencies can all benefit greatly from having access to EPC data.

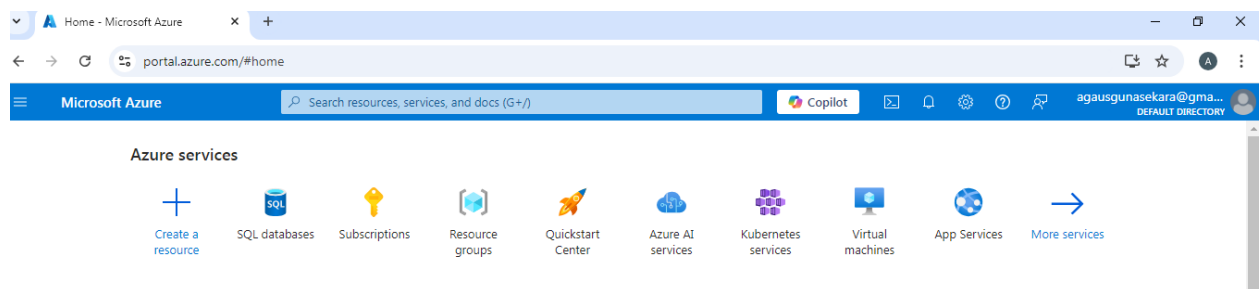

This project will produce a useful, user-friendly dashboard that assists the energy sector in meeting sustainability targets, identifying energy performance trends, and supporting long-term energy saving projects throughout Manchester by utilizing Power BI's sophisticated features.

2) Dataset Explanation

Creating a database in Azure cloud storage.

First you need to login to the Microsoft azure portal using your email.

In the Azure portal, select + Create a resource from the upper left-hand corner and search for Azure SQL. Then in the resulting Azure SQL page, select Create.

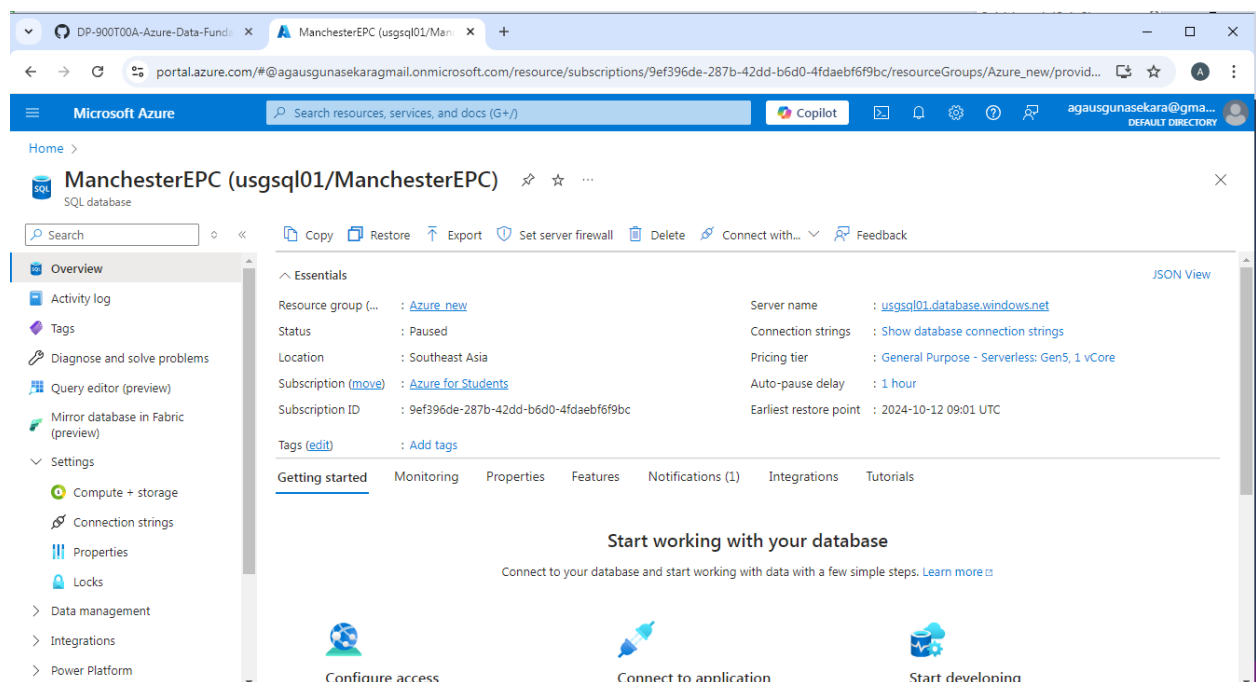

Enter the following values on the Create SQL Database page, and leave all other properties with their default setting:

- Subscription: Select your Azure subscription. (Azure for students)
- Resource group: Create a new resource group with a name of your choice. (████████)
- Database name: ManchesterEPC
- Server: Select Create new and create a new server with a unique name in any available location. (login : ██████████, password : ██████████)
- Want to use SQL elastic pool? : No
- Workload environment: Development
- Compute + storage: Leave unchanged
- Backup storage redundancy: Locally-redundant backup storage

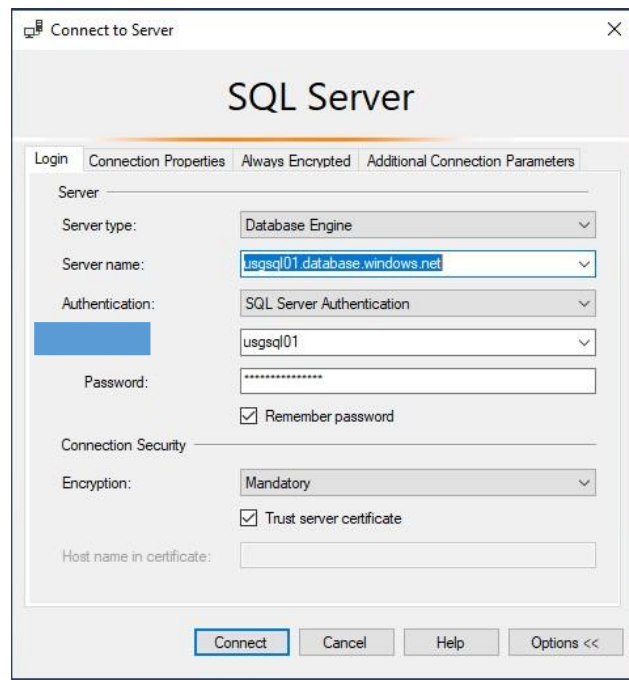

Select Review + Create, and then select Create to create your Azure SQL database.

Wait for process to complete. Then go to the resource that was deployed, which looks as follows.

Connecting the created Database to SQL Server Management Studio (SSMS).

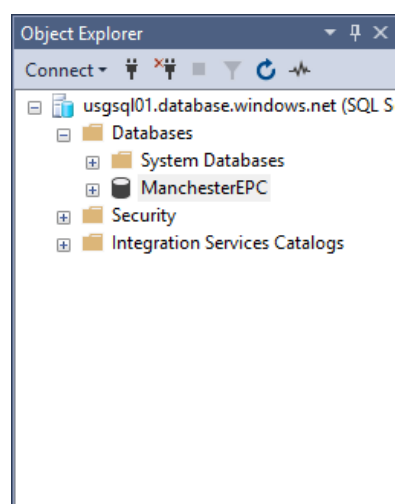

Open the SSMS and connect to server as follows.

Enter the server name correctly and select SQL Server Authentication in Authentication box.

Enter your login name and password there and connect to the server. (Make sure you have verify the trust server certificate box before connect.)

After connected to the server, you can see our created database “ManchesterEPC”.

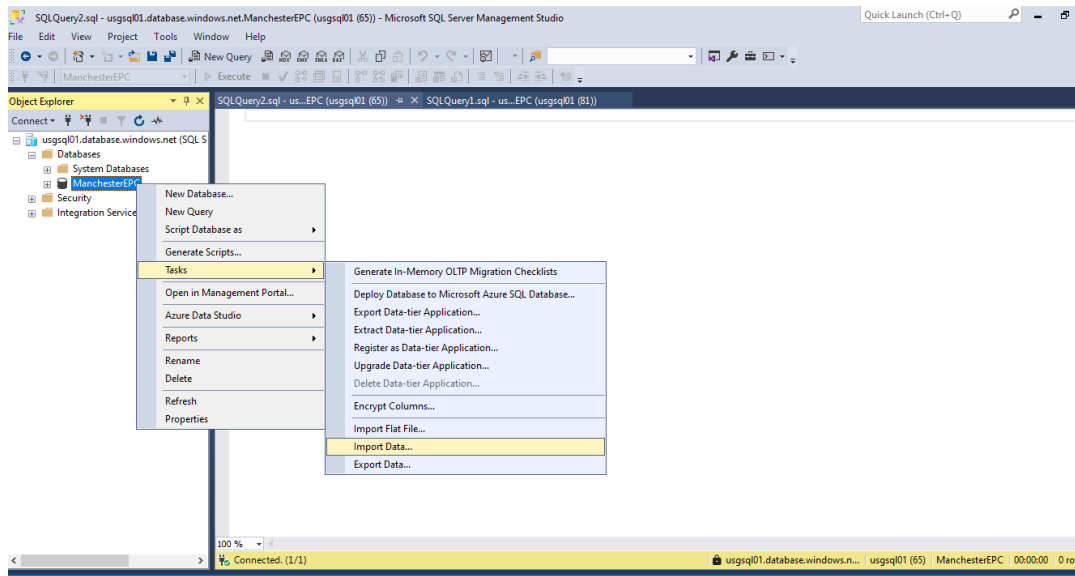

Importing Data from Excel to Microsoft SQL Server Database.

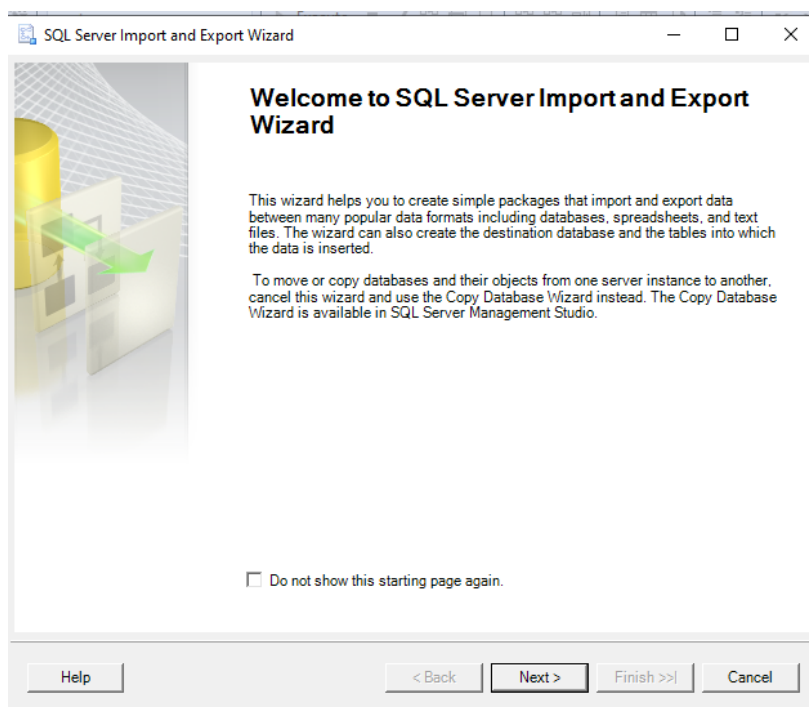

Import the CSV file to the SQL server database “ManchesterEPC”.

a) Right-click the ‘ManchesterEPC’ database.

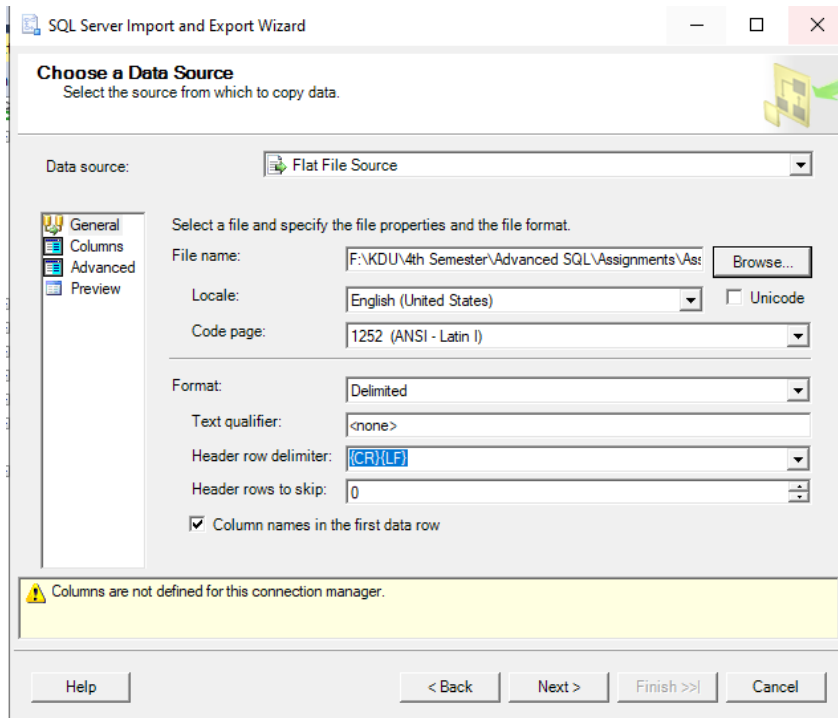

b) Select Tasks → Import Data

c) Click Next on the SQL Server Import and Export Wizard welcome page.

d) Select Flat File Source as the Data Source, and enter or browse for the file to import.

The screenshot shows the 'Choose a Data Source' step of the SQL Server Import and Export Wizard. The 'Data source' dropdown is set to 'Flat File Source'. The 'General' tab is selected in the left-hand pane. The main area contains fields for 'File name' (F:\KDU\4th Semester\Advanced SQL\Assignments\Ast), 'Locale' (English (United States)), 'Code page' (1252 (ANSI - Latin I)), 'Format' (Delimited), 'Text qualifier' (<none>), 'Header row delimiter' ({CR}{LF}), and 'Header rows to skip' (0). A checkbox for 'Column names in the first data row' is checked. A yellow warning bar at the bottom states 'Columns are not defined for this connection manager.' Navigation buttons at the bottom include '< Back', 'Next >', 'Finish >>', and 'Cancel'.

SQL Server Import and Export Wizard

Choose a Data Source
Select the source from which to copy data.

Data source: Flat File Source

General

Select a file and specify the file properties and the file format.

File name: F:\KDU\4th Semester\Advanced SQL\Assignments\Ast Browse...

Locale: English (United States) ☐ Unicode

Code page: 1252 (ANSI - Latin I)

Format: Delimited

Text qualifier: <none>

Header row delimiter: {CR}{LF}

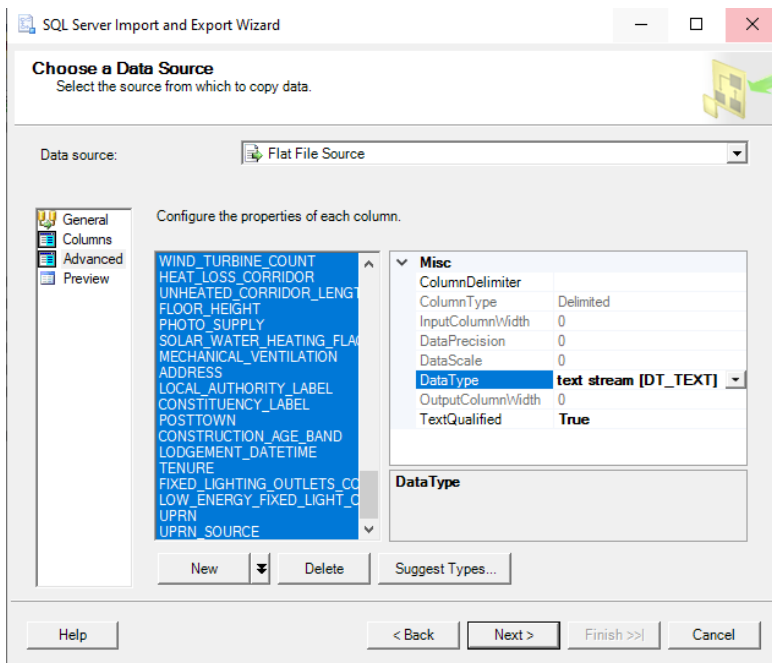

Header rows to skip: 0

☒ Column names in the first data row

Columns are not defined for this connection manager.

Help < Back Next > Finish >> Cancel

e) Go to the Advanced tab and change the datatype from string to text and click Next.

The screenshot shows the 'Choose a Data Source' step of the SQL Server Import and Export Wizard, with the 'Advanced' tab selected. The 'Data source' is 'Flat File Source'. The 'General' tab is selected in the left-hand pane. The main area shows a list of columns on the left and a 'Misc' section on the right. The 'Misc' section includes 'ColumnDelimiter' (Delimited), 'ColumnType' (Delimited), 'InputColumnWidth' (0), 'DataPrecision' (0), 'DataScale' (0), 'DataType' (text stream [DT_TEXT]), 'OutputColumnWidth' (0), and 'TextQualified' (True). A 'Data Type' section is also visible. Navigation buttons at the bottom include '< Back', 'Next >', 'Finish >>', and 'Cancel'.

SQL Server Import and Export Wizard

Choose a Data Source
Select the source from which to copy data.

Data source: Flat File Source

General

Configure the properties of each column.

WIND_TURBINE_COUNT

Help < Back Next > Finish >> Cancel

f) Select Microsoft OLE DB Provider for SQL Server and enter the server name there.

Select SQL Server Authentication and enter the username and password correctly.

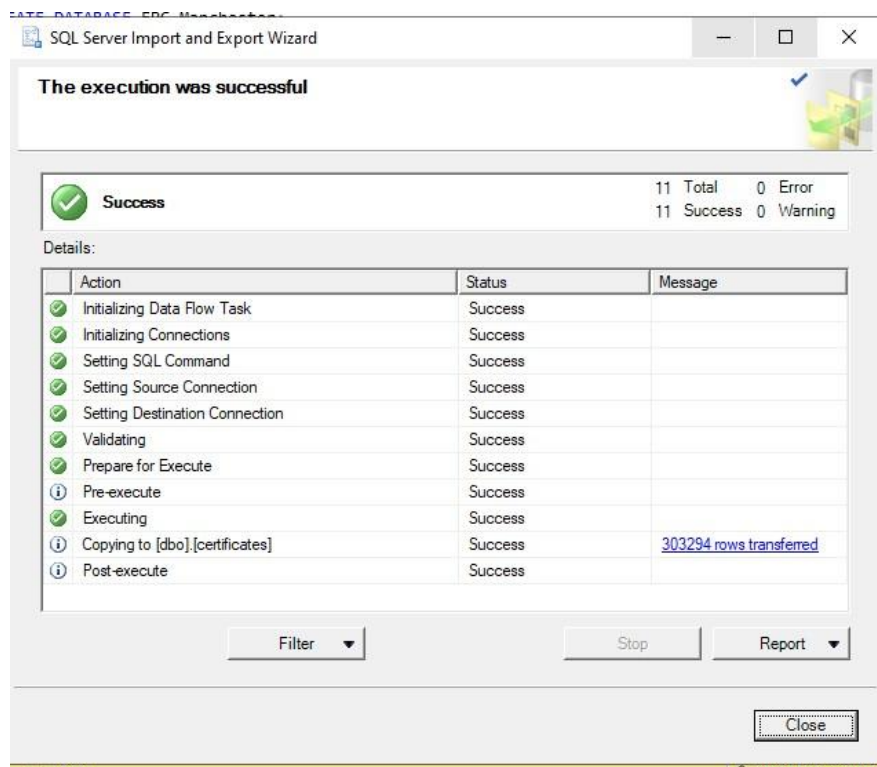

Then click next.

The screenshot shows the 'Choose a Destination' step of the SQL Server Import and Export Wizard. The window title is 'SQL Server Import and Export Wizard'. The main heading is 'Choose a Destination' with the instruction 'Specify where to copy data to.' Below this, there are several fields: 'Destination:' is set to 'Microsoft OLE DB Provider for SQL Server'; 'Server name:' is set to 'usgsq01.database.windows.net'; 'Authentication' has two radio buttons, with 'Use SQL Server Authentication' selected; 'User name:' is 'usgsq01' and 'Password:' is masked with asterisks; 'Database:' is 'ManchesterEPC' with 'Refresh' and 'New...' buttons next to it. At the bottom are 'Help', '< Back', 'Next >', 'Finish >>', and 'Cancel' buttons.

g) Accept the default and click next.

The screenshot shows the 'Save and Run Package' step of the SQL Server Import and Export Wizard. The window title is 'SQL Server Import and Export Wizard'. The main heading is 'Save and Run Package' with the instruction 'Indicate whether to save the SSIS package.' Below this, there are several options: 'Run immediately' is checked; 'Save SSIS Package' is unchecked, with sub-options 'SQL Server' and 'File system'; 'Package protection level:' is set to 'Encrypt sensitive data with user key'; 'Password:' and 'Retype password:' fields are empty. At the bottom are 'Help', '< Back', 'Next >', 'Finish >>', and 'Cancel' buttons.

h) Click Finish.

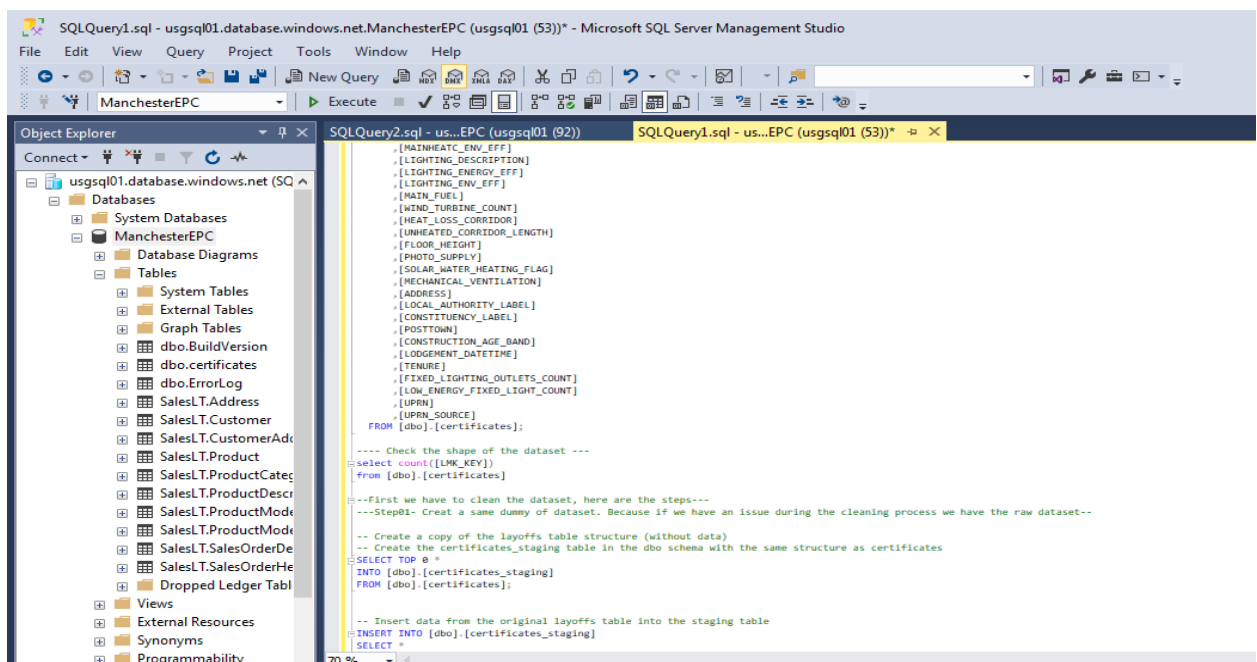

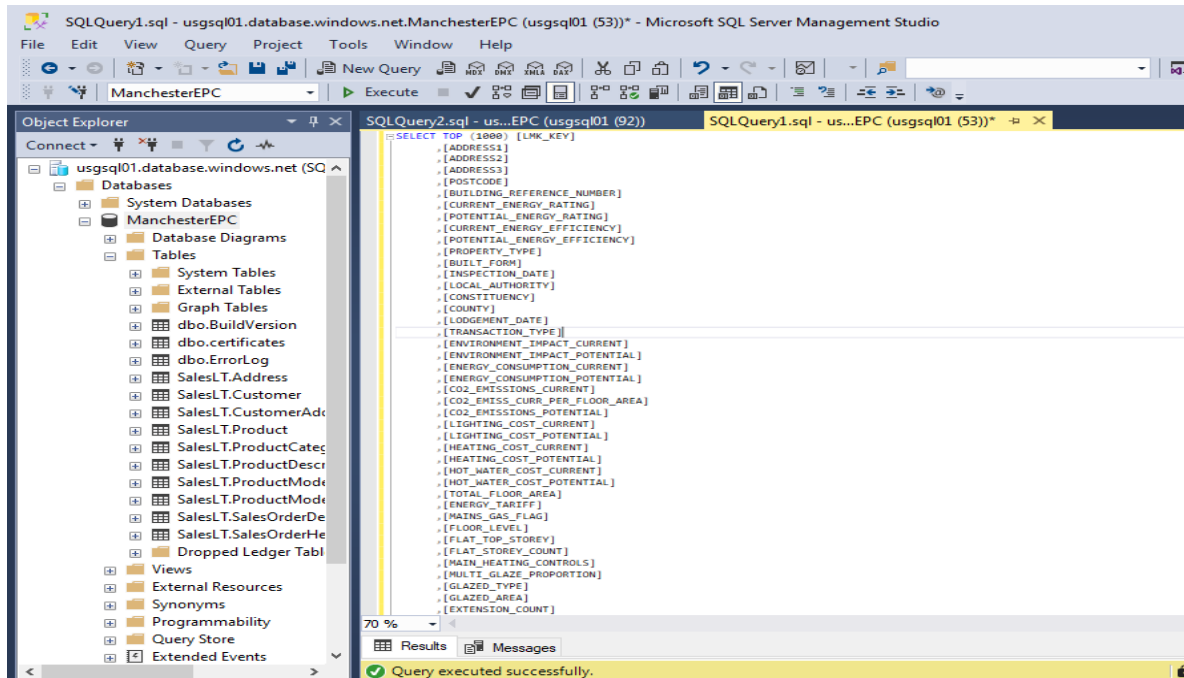

The Execution Results dialog box appears. Assuming that all went well, the data has loaded successfully.

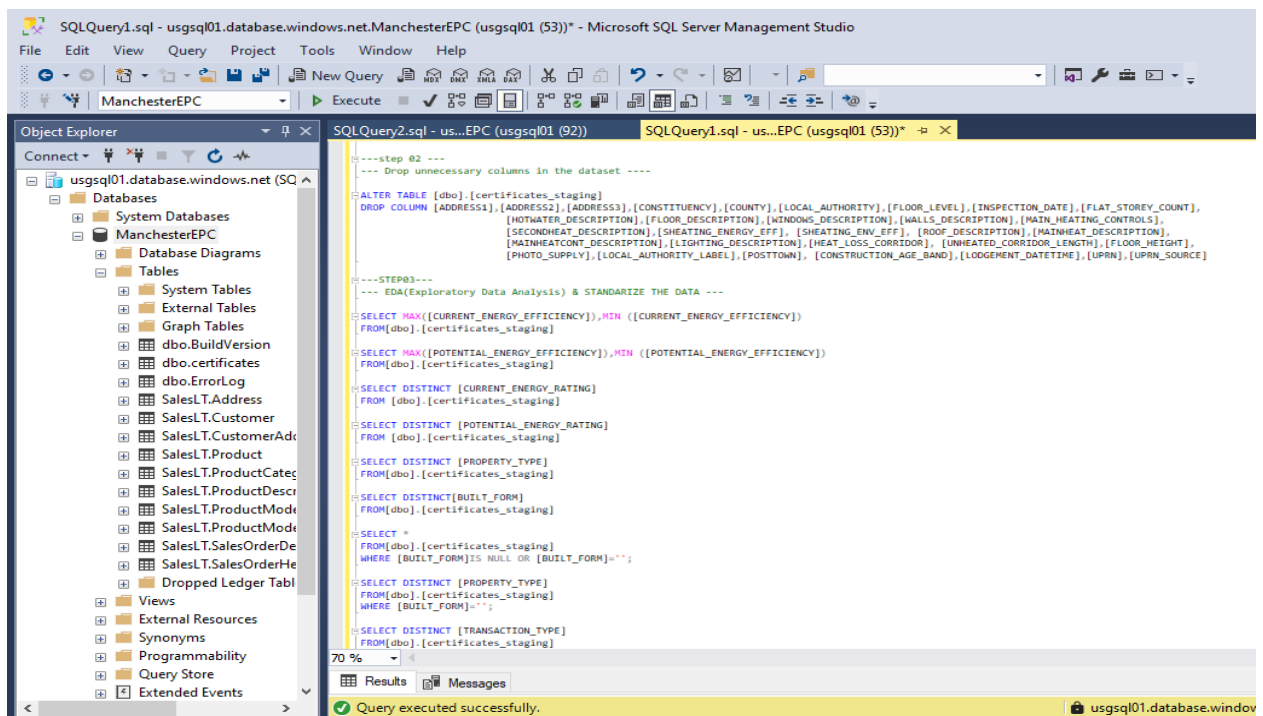

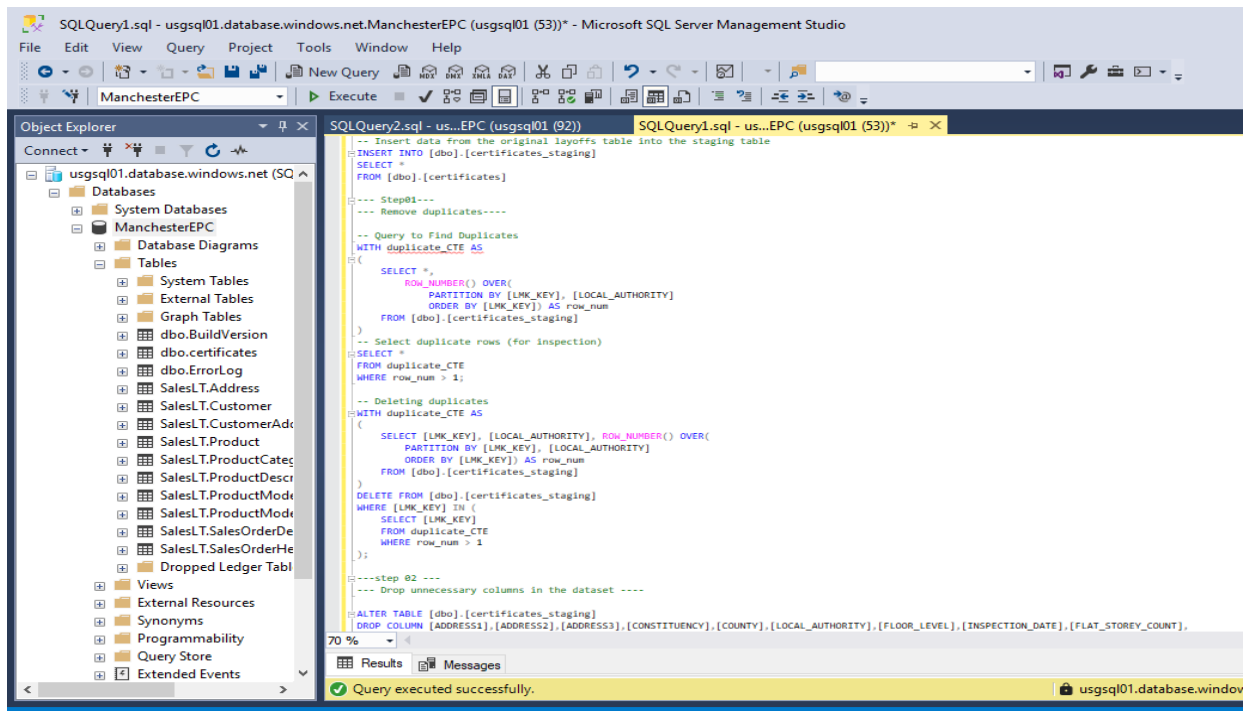

After we can see the new table 'dbo.certificates' in the 'ManchesterEPC' database.

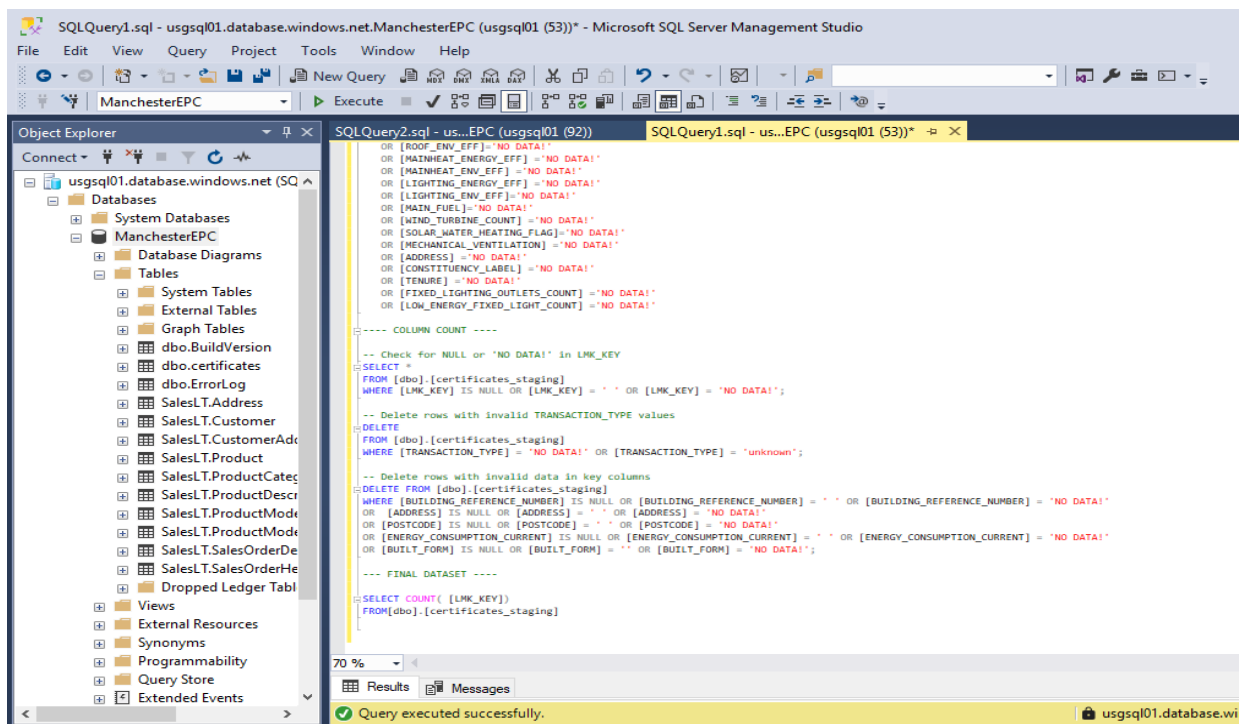

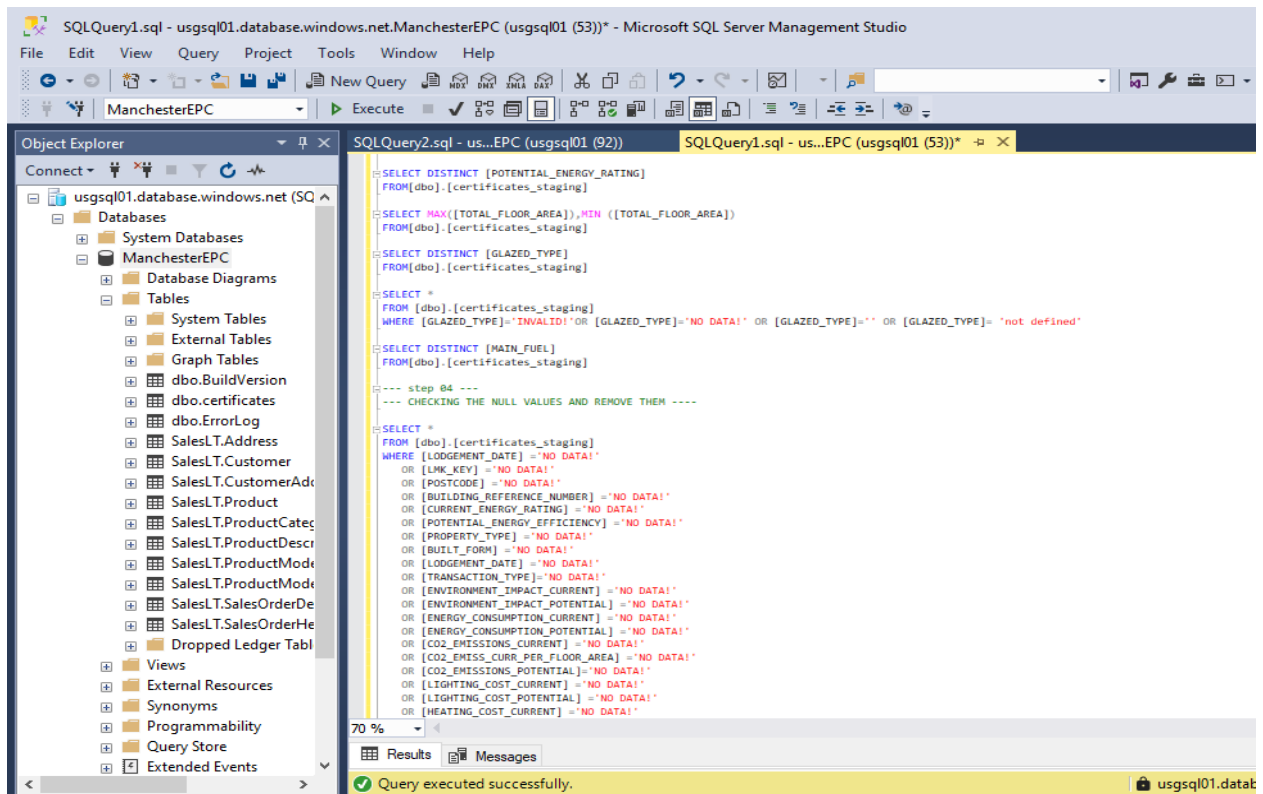

Cleaning the data

Under a new query, enter the following code to clean the 'dbo.certificates' dataset.

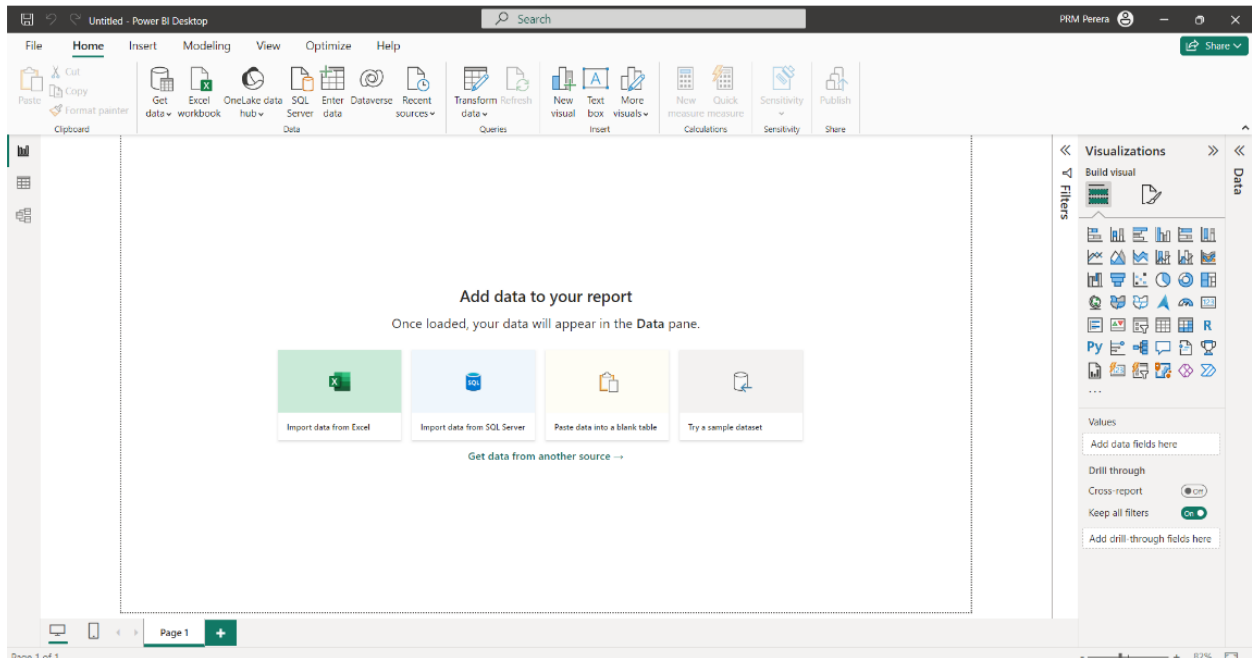

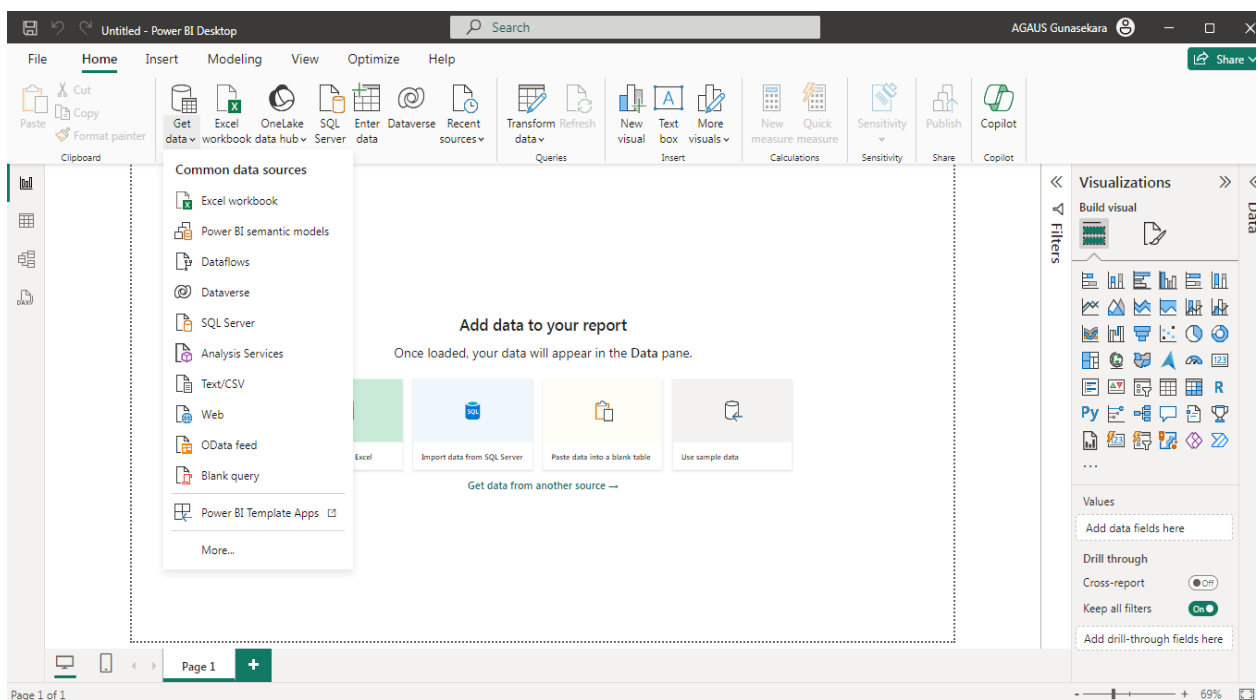

Dashboard design and Implementation

Bring Data into Power BI

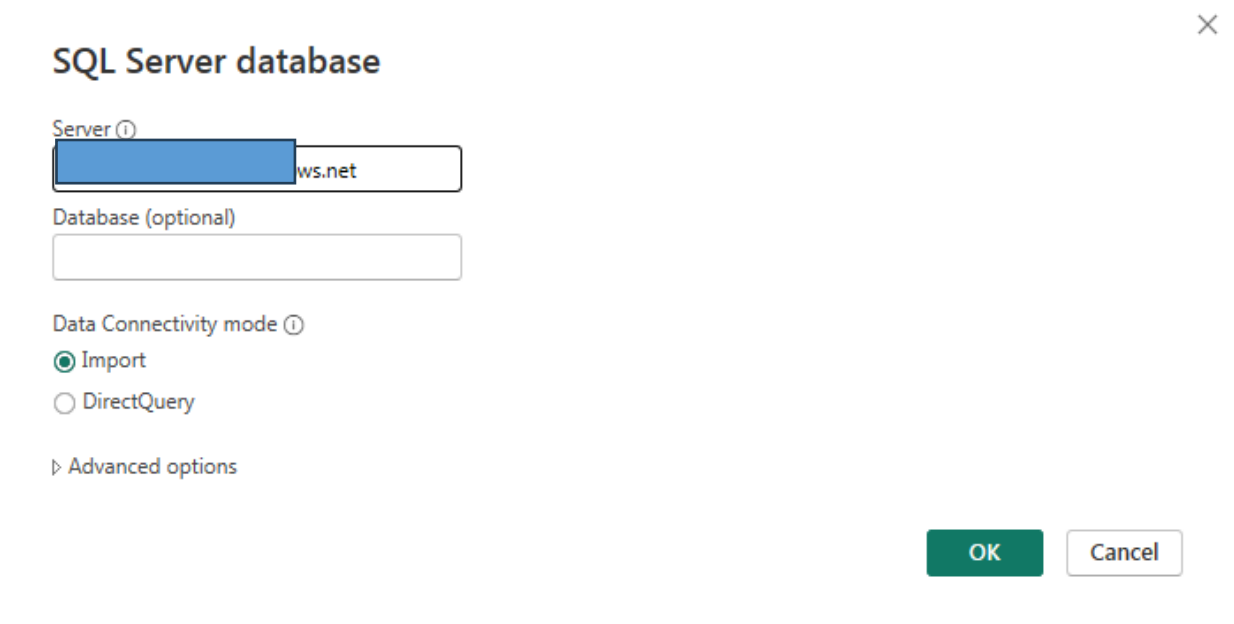

Open Power BI desktop

In Home tab, select Get Data → SQL Server

From SQL Server Database Server connect to your server. Enter the server name correctly in the dialogue box and click OK.

SQL Server database

Server ⓘ
[Redacted]ws.net

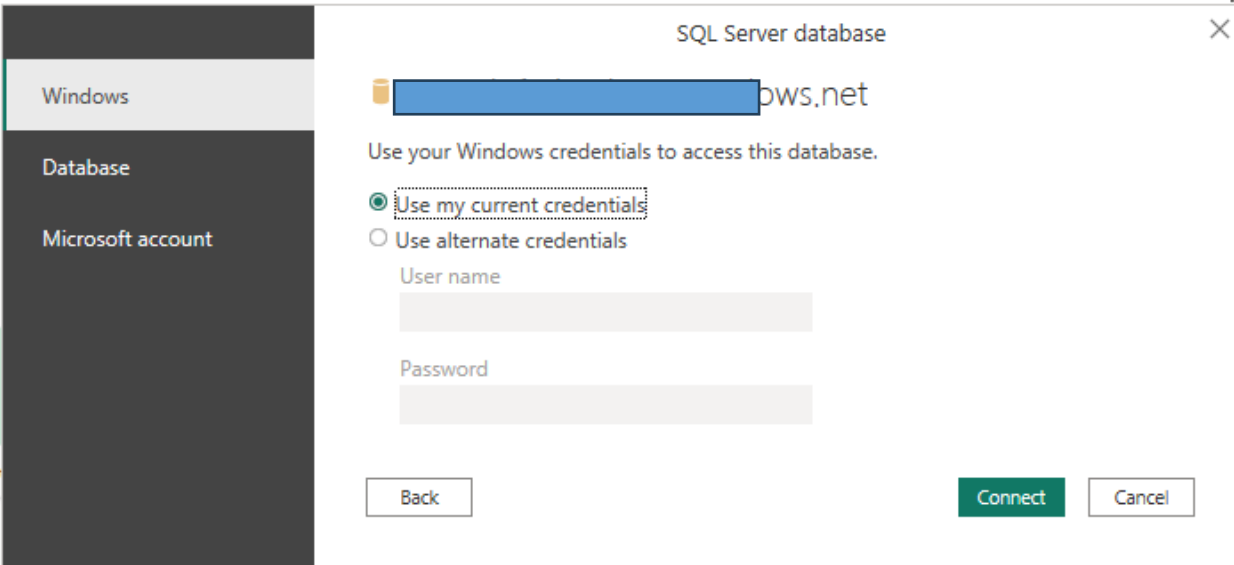

Database (optional)
[Redacted]

Data Connectivity mode ⓘ
☒ Import
☐ DirectQuery

▶ Advanced options

OK Cancel

Enter the server username and password under the database section as follows.

SQL Server database

Windows
Database
Microsoft account

Use your Windows credentials to access this database.

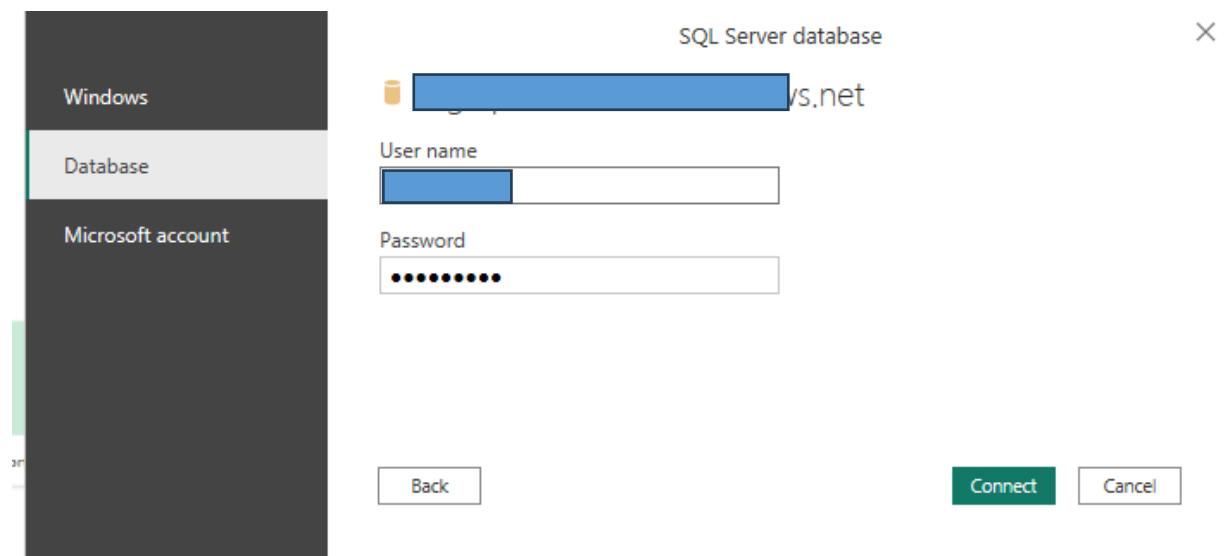

☒ Use my current credentials
☐ Use alternate credentials

User name
[Redacted]

Password
[Redacted]

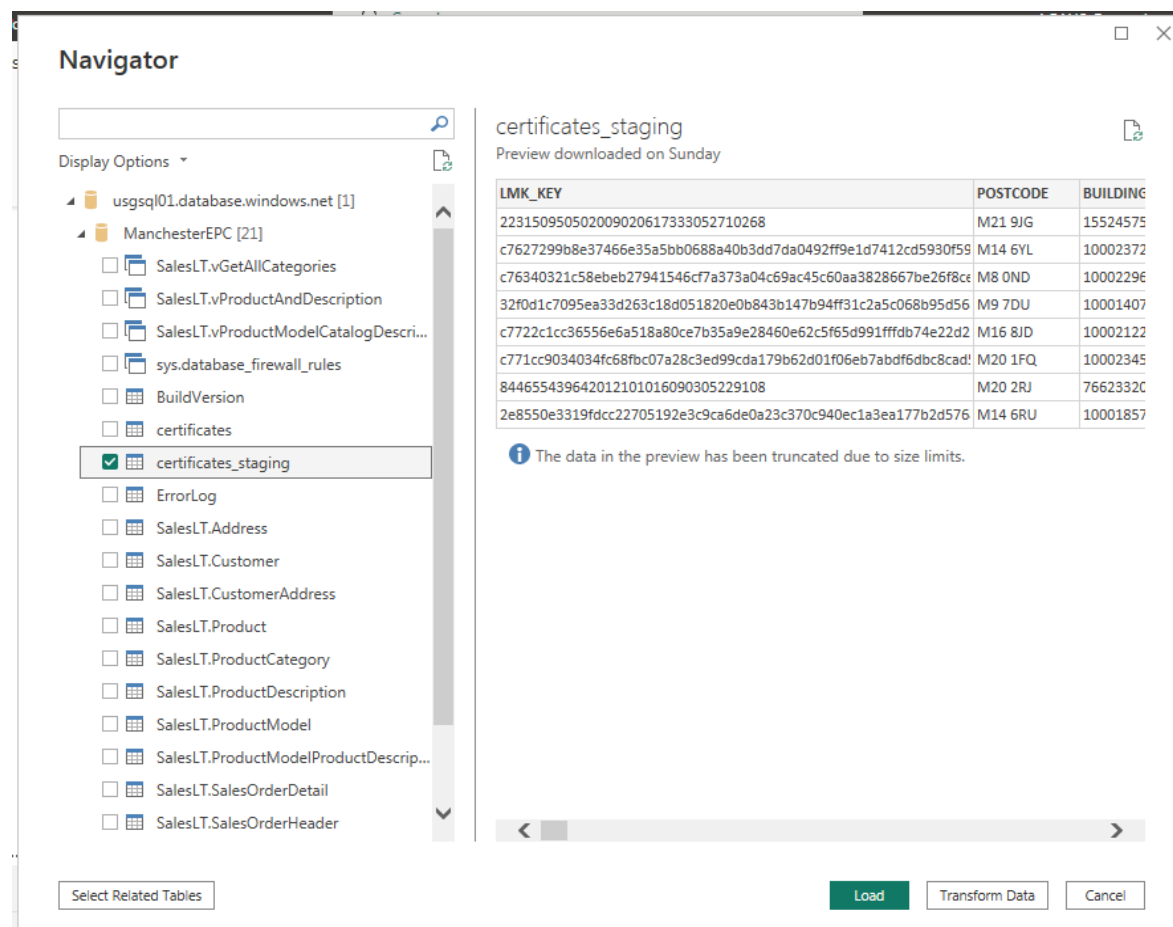

Back Connect Cancel

Then click on connect.

03. Power BI Dashboard

In Navigator tab, select 'certificates_staging' dataset from 'ManchesterEPC' Database which we have cleaned previously. Then select transform data.

Then your dataset will be transformed into Power Query Editor as follows.

Query Settings

PROPERTIES

Name: certificates_staging

APPLIED STEPS

To create relevant data models using DAX, the data type of some columns have changed as follows.

- CO2_EMISSIONS_CURRENT
- CO2_EMISSIONS_POTENTIAL
- CURRENT_ENERGY_EFFICIENCY
- POTENTIAL_ENERGY_EFFICIENCY

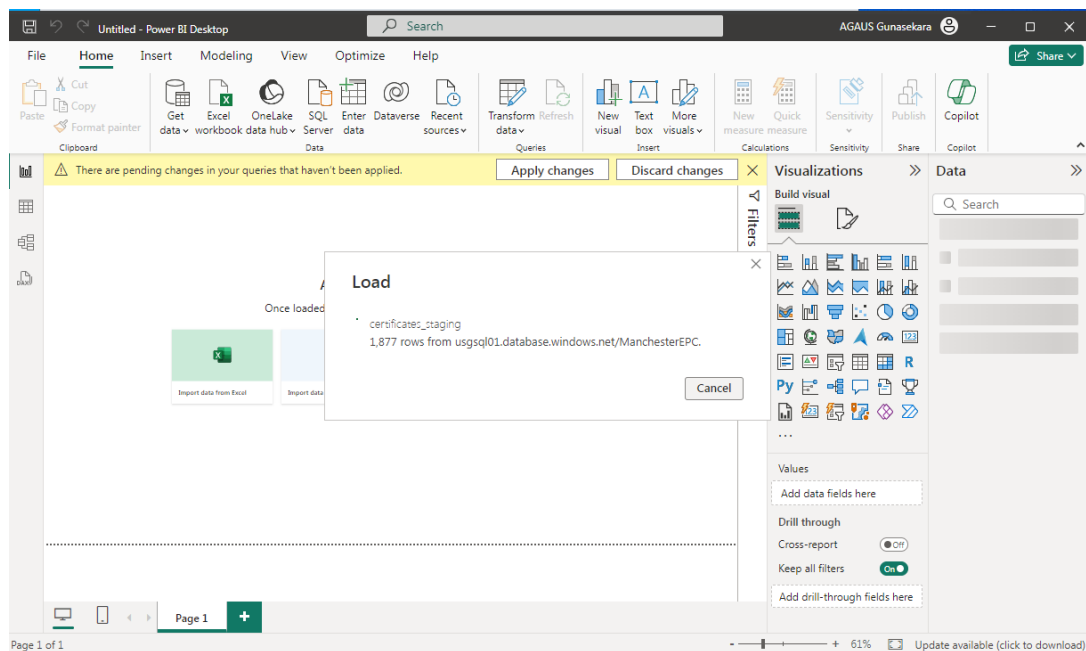

The datatype of the above columns have changed from string to numeric (Text → Decimal Number).

The screenshot shows the Power Query Editor interface. The main table has columns: 1.2 CO2_EMISSIONS_CURRENT, A CO2_EMISSIONS_CURRENT_PER_FLOOR, A CO2_EMISSIONS_POTENTIAL, A B LIGHTING_COST_CURRENT, and A B LIGHTING_COST_POTENTIAL. A context menu is open over the 'CO2_EMISSIONS_CURRENT' column, with 'Change Type' selected. The 'Changed Type' dialog is also visible, showing the current data type as 'Text'.

Further, some rows are filtered as follows.

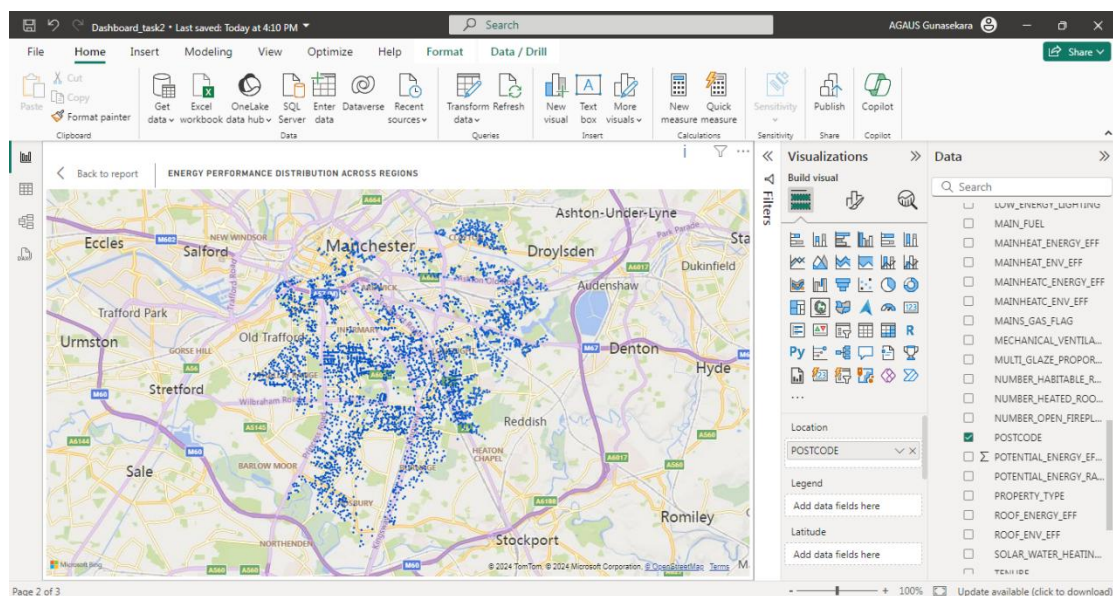

The screenshot shows the Power Query Editor interface. The main table has columns: A BUILDING_REFERENCE_NUM, A CURRENT_ENERGY_RATING, A POTENTIAL_ENERGY_RATING, 1.2 CURRENT_ENERGY_EFFICIENCY, and 1.2 POTENTIAL_ENERGY_EFFICIENCY. A 'Text Filters' dialog is open, showing a list of values for the 'CURRENT_ENERGY_RATING' column. The 'Filter Rows' step is applied in the 'APPLIED STEPS' pane.

Then select on Close and Apply to do create the dashboard. It will load the finalized dataset to the Power BI desktop.

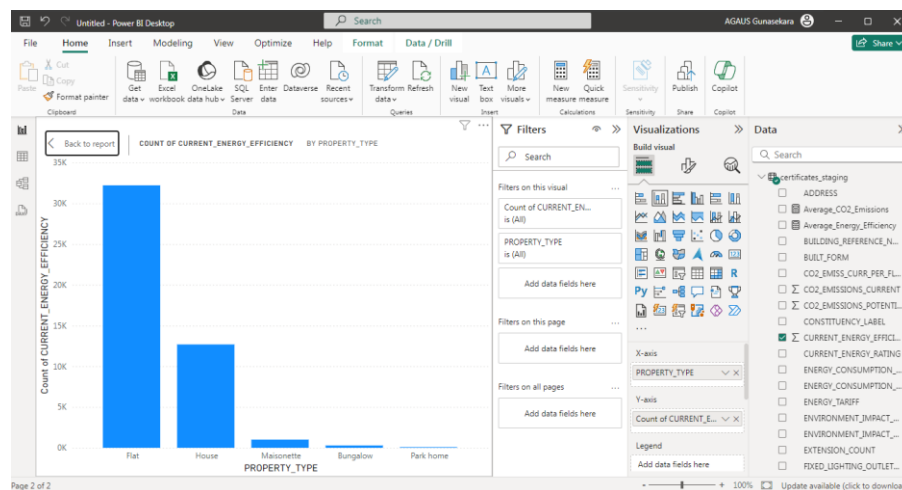

Dashboard Draw up

Creating the Map

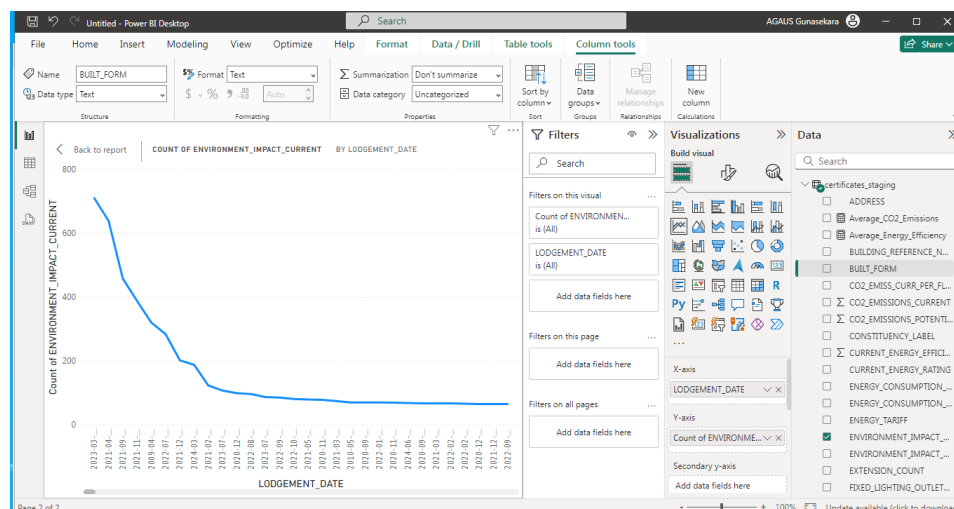

The map visualizes a geospatial representation of Greater Manchester properties, within the United Kingdom. It displays the distribution of energy performance across different regions within Greater Manchester. The dots represents individual data points, potentially corresponding to locations within the region. This map visualization helps to identify areas with higher or lower energy efficiency in Greater Manchester.

Creating the Column chart

The above graph presents a comparison of the "Count of CURRENT_ENERGY_EFFICIENCY" across different "PROPERTY TYPE" categories. The x-axis represents the "PROPERTY TYPE" categories (Flat, House, Maisonette, Bungalow, Park home), while the y-axis displays the "Count of CURRENT_ENERGY_EFFICIENCY." The height of each bar corresponds to the number of properties in that particular "PROPERTY TYPE" category with a recorded "CURRENT_ENERGY_EFFICIENCY." The bar graph effectively illustrates the distribution of "CURRENT_ENERGY_EFFICIENCY" among different property types, allowing for easy comparison and identification of trends.

Creating the Line chart

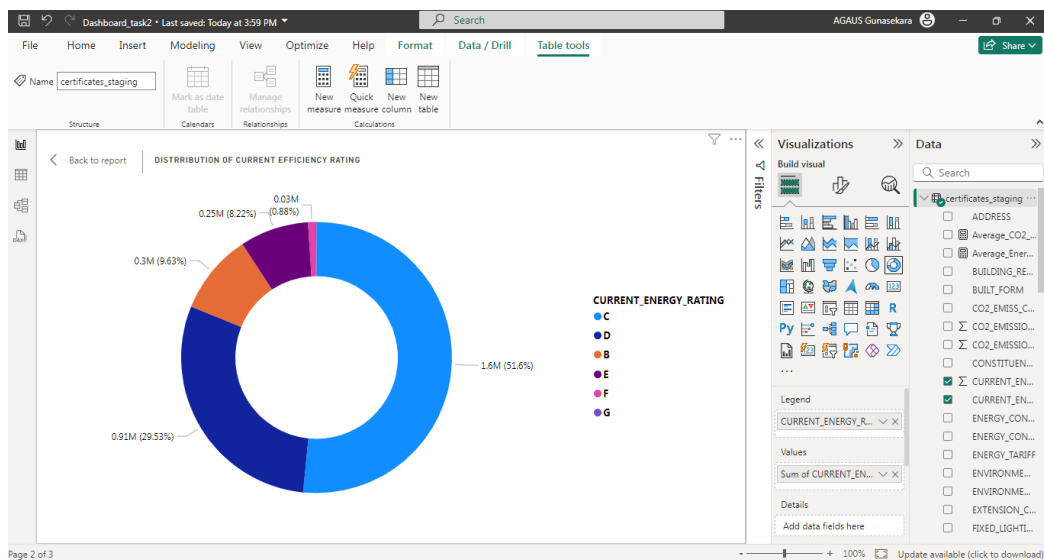

The line chart represents a time series analysis of the "Count of ENVIRONMENT_IMPACT_CURRENT" over a period spanning from 2013 to 2023. The x-axis represents "LODGEMENT_DATE," indicating the time progression of the data. The y-axis displays the "Count of ENVIRONMENT_IMPACT_CURRENT," suggesting the number of environmental impact occurrences over time. The line chart shows a general downward trend, indicating a decrease in the number of environmental impact cases over the years.

Creating the Pie chart

The pie chart is a representation of the distribution of "BUILT FORM" categories in Greater Manchester. The pie chart is divided into segments, each representing a different "BUILT FORM" type. The chart includes a legend that identifies the different "BUILT FORM" types and their corresponding percentages. This visualization provides a clear and concise overview of the relative prevalence of each "BUILT FORM" category in the data.

Creating the Donut chart

The donut chart shows the distribution of current energy ratings among domestics in Greater Manchester. The categories represent the different energy ratings, ranging from A to G, with A indicating the highest efficiency and G the lowest. The chart reveals that the majority of properties fall within the D category, followed by the C category. The remaining categories, from B to G, have relatively smaller proportions.

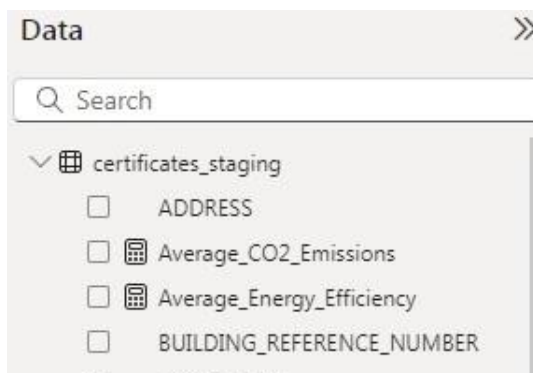

Creating the KPI

Use of DAX to calculate average values.

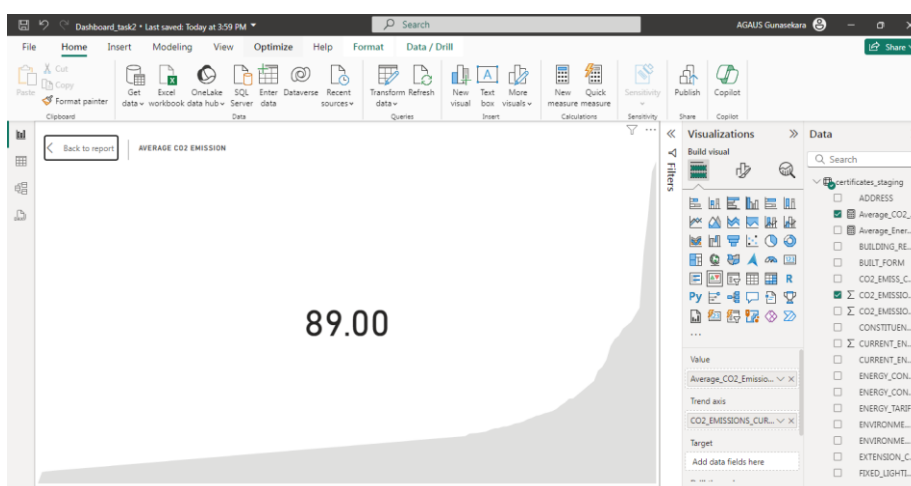

Before create KPIs we need to find the average values for current CO2 Emission and current energy efficiency. For that we can click on 'New measure' on the toolbar tab and enter the code as follows.

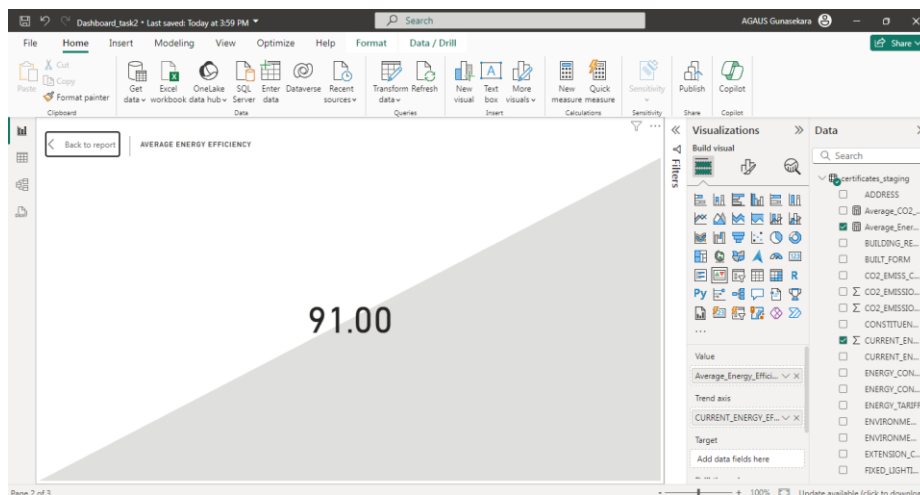

This will create you 2 new measures 'Average_CO2_Emissions' and 'Average_Energy_Efficiency'.

Creating KPI

The above KPIs highlights two important metrics related to domestic energy performance in Greater Manchester. The Average CO2 Emission is measured at 89.00, indicating the typical carbon emissions generated by residential properties, which is a key factor in assessing environmental impact. The Average Energy Efficiency is 91.00, reflecting the overall efficiency of energy use within these homes. These metrics provide an essential overview of the region's energy performance and serve as benchmarks for evaluating future improvements in energy efficiency and emission reduction.

Creating Filters

PROPERTY_TYPE

All
☐ Bungalow
☐ Flat
☐ House
☐ Maisonette
☐ Park home

ENERGY_TARIFF

All
☐ NO DATA!
☐ off-peak 10 hour
☐ off-peak 18 hour
☐ off-peak 7 hour
☐ Single
☐ standard tariff

CURRENT_ENERGY_RATING

All

☐ C
☐ D
☐ E
☐ F
☐ G

GLAZED_TYPE

All
☐
☐ "double
☐ "double glazing
☐ double glazing installed before 2002
☐ double glazing installed during or after 2002

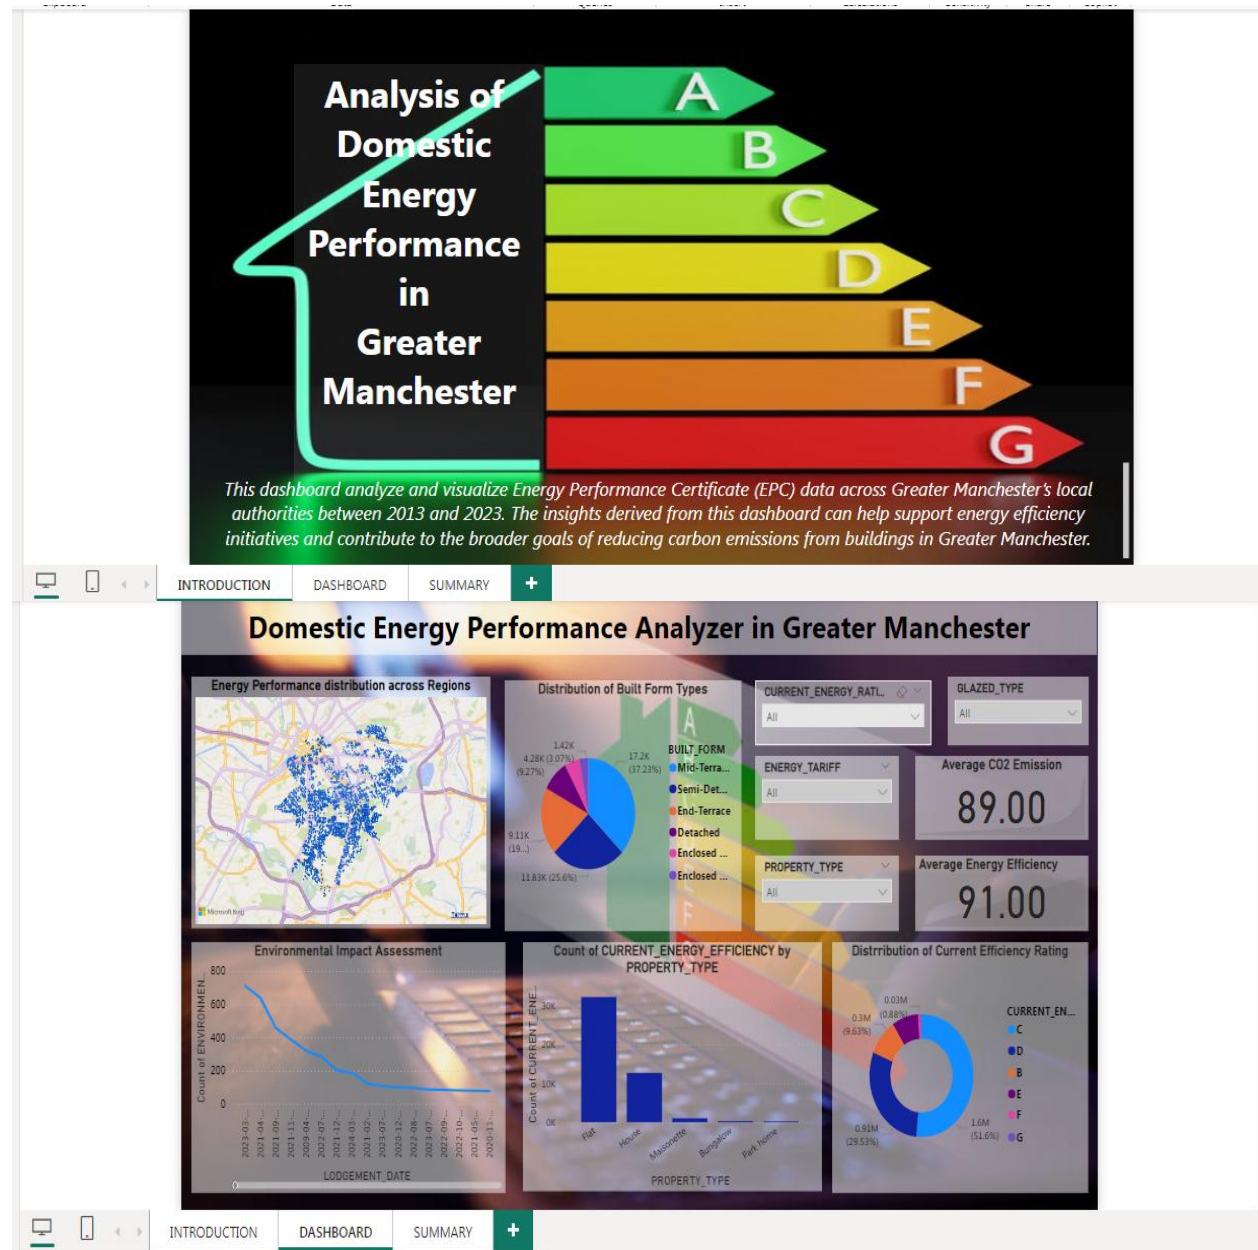

The above filters allow users to filter out the analysis by selecting specific property types, energy tariffs, current energy ratings, and glazing types. By applying these filters, users can focus on particular segments of the data and gain deeper insights into the energy performance characteristics of different property types, energy usage patterns, and glazing types.

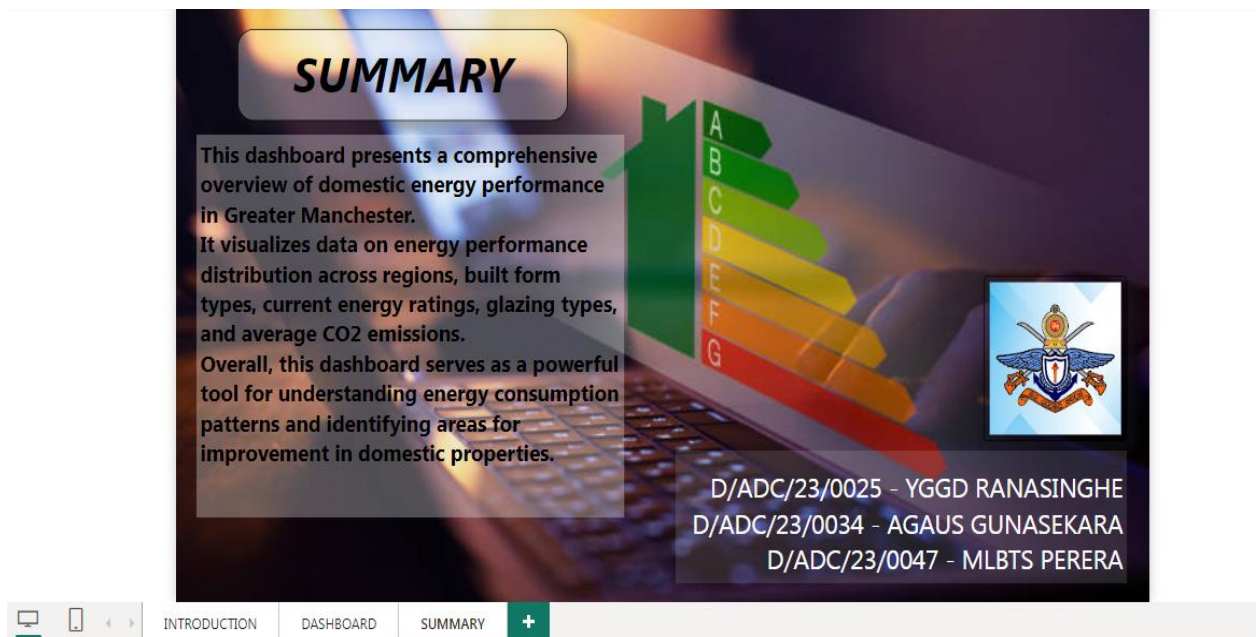

Edit the Dashboard

We edited the font sizes, font colors, backgrounds, images in the visualization parts.

As the next step, we arranged three pages in the whole Dashboard Document.

The 1st page is for the introduction, 2nd page is for the dashboard and 3rd page is for the summary.

f) Finalized Dashboard.

Domestic Energy Performance Analyzer in Greater Manchester

INTRODUCTION

DASHBOARD

SUMMARY

+

SUMMARY

This dashboard presents a comprehensive overview of domestic energy performance in Greater Manchester.

It visualizes data on energy performance distribution across regions, built form types, current energy ratings, glazing types, and average CO2 emissions.

Overall, this dashboard serves as a powerful tool for understanding energy consumption patterns and identifying areas for improvement in domestic properties.

D/ADC/23/0047 - MLBTS PERERA

INTRODUCTION

DASHBOARD

SUMMARY

+

4) Conclusion

A dashboard provides a comprehensive and easily digestible overview of data, fostering better decision-making, collaboration, and performance monitoring to the viewers. The above dashboard provides a comprehensive overview of domestic energy performance in Greater Manchester. It includes several visualizations that present various aspects of energy efficiency, built form types, and environmental impact. Therefore, by looking at the above dashboard viewers can get an idea about the domestic energy performance in Greater Manchester. The map displays the distribution of energy performance across different regions within Greater Manchester while Pie chart shows the distribution of built form types and current efficiency ratings. The line chart illustrates the trend of environmental impact assessments over time. The bar chart compares the count of current energy efficiency by property type. Overall, the dashboard offers a valuable tool for analyzing domestic energy performance in Greater Manchester. It enables stakeholders to identify areas for improvement, understand the impact of different building types, and track progress in environmental sustainability efforts.

5) Recommendations

Prioritize energy efficiency in new developments: The distribution of built form types shows a prevalence of older, less energy-efficient structures. Encouraging the construction of new homes and buildings with high energy efficiency standards can significantly reduce overall energy consumption in the region.

Encourage the adoption of renewable energy: The region can benefit from investing in renewable energy sources like solar panels and wind turbines. Providing financial incentives and simplifying the installation process can encourage homeowners and businesses to adopt these sustainable energy solutions.

Implement targeted energy efficiency programs: Developing and implementing tailored energy efficiency programs for specific demographics, such as low-income households and small businesses, can help address energy poverty and improve energy efficiency across the region.

Promote energy awareness and education: Raising public awareness about energy efficiency and implementing educational campaigns, providing energy-saving tips, and organizing community events can help empower residents and businesses to make informed decisions about energy consumption.
